

KRISTINA MAKARIN

JUNIOR DATA ANALYST

ABOUT ME

Biomedical Engineering Graduate transitioning into Data Analysis. Combines a rigorous engineering background with hands-on expertise in SQL, Python, and relational database analysis. Self-motivated and detail-oriented professional eager to apply analytical problem-solving to complex data workflows and derive actionable business insights.

SKILLS

- **Data & Analytics:** SQL (PostgreSQL, Relational Databases, Queries & CTEs), Python (Pandas, NumPy, Matplotlib, Seaborn), MS Excel & Google Sheets (Data Manipulation, Advanced Functions, Reporting), Power BI (Data Modeling, Interactive Dashboards - In Progres)
- **Web Fundamentals:** HTML5, CSS3 / SCSS, JavaScript (Basic), Responsive Design
- **Developer Tools:** Git, GitHub, VS Code

LANGUAGES

- **Serbian** (native)
- **English:** B2 (Upper-Intermediate)

EDUCATION

BACHELOR OF BIOMEDICAL ENGINEERING

Faculty of Technical Sciences

COMMERCIAL TECHNICIAN

Economic High School

WORK EXPERIENCE

WAITRESS

Bar & Lounge Moskva

2020 - 2025

- Five years of consistent service demonstrating reliability, strong communication, and multitasking skills in a high-volume environment.

WORK AND TRAVEL PROGRAM – USA (SUMMER 2018)

- Participated in the Work and Travel program gaining international experience. Improved communication, adaptability and problem solving while collaborating with diverse teams.

PROJECTS

OLIST E-COMMERCE ANALYTICS | SQL, PYTHON (PANDAS)

github.com/kristinamakarin/Olist_Ecommerce_Analysis

- Formulated & answered 11 core business questions across a 9-table relational schema (~100K orders) using SQL (CTEs, JOINs, Aggregations) to evaluate revenue, customer retention, logistics performance, and review sentiment.
- Uncovered critical e-commerce insights: Discovered a 97% one-time customer rate, identified a 19% late-delivery peak in March 2018, and proved that 6.7% late orders averaged 2.27 stars (vs. 4.29 on-time) and accounted for ~33% of all negative reviews.

BANK CUSTOMER CHURN ANALYSIS | SQL (POSTGRESQL), VS CODE

github.com/kristinamakarin/SQL_Project_Bank_Customer_Churn

- Formulated & answered 9 targeted analytical questions on 10,000 customer records using SQL (CTEs, subqueries, CASE, HAVING, CROSS JOINs) to establish baselines and evaluate churn across demographics and product tiers.
- Uncovered critical financial & retention drivers: discovered churned users held 25% higher balances ($185.6M lost), identified 3–4 product holders as the highest risk (83–100% churn vs 7.58% for 2 products), and built a dynamic multi-factor risk segmentation model.
